

## ■ LED Front sub turn signal For NINJA 250R

An embedded LED sub- turn signal for use when removing the stock front mirror and installing built in turnsignal mirror on the NINJA 250R. When you remove the stock front turn signal, the concave portion is left on the cowling, which negatively impacts the style of the vehicle. This LED sub-winker fits perfectly into the concave portion created by the removal of the stock winker and does not protrude, meaning that the front cowl looks beautiful and smooth.

LEDs are arranged with 12 in the front and 3 along the side, providing superior visibility for a sub-turn signal.

Also, wires are compatible with stock couplers meaning that no wiring work is required and installation is possible simply by attaching the wiring. Turn signal attached by double coated tape. **※Must use with wide range turn signal relay.**

### ■ Vehicles requirements

When using the LED turn signals in the front and stock turn signal rear, they will flash properly.

When using the LED turn signals in the rear, they will no flash properly and will fail to function as signals.

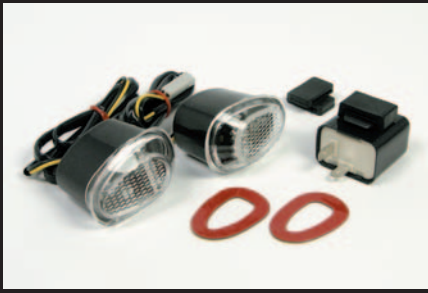

To simultaneously convert rear turn signal to LED, you must create and attach wiring for the indicator that uses a rectified diode.

The method for creating this wiring and types of diodes used are indicated in the parts manual.

### ※NOTE

This sub-turn signal is only for use secondarily. The illumination of this sub-turn signal only is not pass the standards for public road vehicle operation. (Japanese domestic law)

Vehicles cannot be operated on public roads when only the sub-winker is installed.
