

■ Power filter

CYGNUS-X SR (SEA5J)
CYGNUS-X (2UB)

By replacing it with a stock air filter, the suction efficiency improves and even if it is attached to a stock engine, it will be possible to increase the power at the all range from low rpm to high rpm. It is great compatibility with our S-Stage bore up kit. Its effects better intake air flow than stock air filter and get the S-Stage performance perfectly. Since the stock air cleaner box is used as it is, there is not loud intake noise. It can run in rainy weather without worried about water leak. You can use it for street running just as stock. Because it is a sponge element, it can be easily washed with water if it becomes dirty.

■ Regarding the setting when installing this power filter.

When used for a stock engine, it is not necessary to use with FI CON 2 (injection controller).
