

## ■ Super starter

CYGNUS-X / CYGNUS-X SR(5UA)  
 CYGNUS-X(FI) / CYGNUS-X SR(FI) (28S) (1YP)  
 CYGNUS-X SR(FI) (BF91)  
 CYGNUS-X(FI) (Taiwan model/2UB1)

Specially designed starter motor for our bore up kit.

Even when you use the high compression / large bore piston of the bore-up engine, this starter can start the engine smoothly. If you try to start the bore-up engine with the stock starter motor, the torque will be insufficient, the activation time of the starter motor will increase, the burden on the motor and the battery will increase. Start the engine with a large torque and shorten the activation time of the starter motor.

By adopting a magnet that generates powerful magnetic force, the super starter makes high power without enlarging the motor size, making it possible to achieve light weight and compactness. It is compact same as the stock starter size and possible to install just like stock even in the crowded and narrow that the starter motor mounted area.

Reference weight comparison ■ Genuine starter motor: Approx. 900 g ■ Super starter: Approx. 870 g

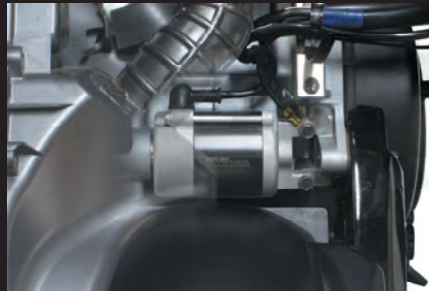

Can be used for both CYGNUS X (carburetor model) and (injection model).

Motor body = Black paint finish. (TAKEGAWA logo mark stamped)

※Especially when installing on an FI (fuel injected) engine, the injector may not inject enough and it may not be able to start at low voltage.

Super starter
